Chapter 08
Multigrid as a Multipilcative Process

Introduction

In this chapter, we reformulate some of our multigrid algorithms using objects called T matrices. We use the same finite element setting as in Chapter 06. However, the ideas can be generalized. This reformulation will make it obvious that the standard multigrid methods are multiplicative GLIS methods.

Multilevel Matrices

Definition (Multilevel Prolongation Matrix)

Suppose $0 \leq j < \ell$. Define the **multilevel prolongation matrix**, $\mathsf{P}_{j,\ell}$, via

$$\mathsf{P}_{j,\ell} := \mathsf{P}_{\ell-1}\mathsf{P}_{\ell-2}\cdots\mathsf{P}_{j} \in \mathbb{R}^{n_\ell \times n_j}.$$

In particular,

$$\mathsf{P}_{\ell-1,\ell} = \mathsf{P}_{\ell-1} \in \mathbb{R}^{n_\ell \times n_{\ell-1}}.$$

Proposition

Suppose $v_j \in V_j$ for some $0 \leq j < \ell$, where $V_0 \subset V_1 \subset \cdots \subset V_\ell$ are the usual nested finite element spaces. Let $\boldsymbol{v}_j \in \mathbb{R}^{n_j}$ be the coordinate vector of v_j with respect to the basis $\mathcal{B}_j$. Then, the unique coordinate vector of $v_j \in V_\ell$ in the basis $\mathcal{B}_\ell$ is

$$\mathsf{P}_{j,\ell}\boldsymbol{v}_j \in \mathbb{R}^{n_\ell}.$$

Proof.

Simple exercise. □

Definition (Multilevel Restriction Matrix)

Define $\mathsf{R}_{j,\ell} \in \mathbb{R}^{n_j \times n_\ell}$, for $0 \leq j < \ell$, via

$$\mathsf{R}_{j,\ell} = \mathsf{P}_{j,\ell}{}^{\top}.$$

$\mathsf{R}_{j,\ell}$ is called the **multilevel restriction matrix**.

Proposition

With the usual construction for the conforming finite element method, we have, for any $0 \leq j < \ell$,

$$\mathsf{A}_j = \mathsf{R}_{j,\ell}\mathsf{A}_\ell\mathsf{P}_{j,\ell} \in \mathbb{R}^{n_j \times n_j}.$$

Proof.

This follows because the Galerkin condition holds:

$$\begin{aligned} \mathsf{A}_j &= \mathsf{R}_j \mathsf{A}_{j+1} \mathsf{P}_j \\ &= \mathsf{R}_j \mathsf{R}_{j+1} \mathsf{A}_{j+2} \mathsf{P}_{j+1} \mathsf{P}_j \\ &\vdots \\ &= \mathsf{R}_j \cdots \mathsf{R}_{\ell-1} \mathsf{A}_\ell \mathsf{P}_{\ell-1} \cdots \mathsf{P}_j \\ &= \mathsf{R}_{j,\ell} \mathsf{A}_\ell \mathsf{P}_{j,\ell}. \end{aligned}$$

$\square$

Definition

For any $0 \leq j < \ell$, define the matrix

$$\Pi_{j,\ell} := \mathsf{A}_j^{-1}\mathsf{R}_{j,\ell}\mathsf{A}_\ell \in \mathbb{R}^{n_j \times n_\ell}.$$

Proposition

We have, for $0 \leq j < \ell$,

$$\Pi_{j,\ell} := \Pi_j \Pi_{j+1} \cdots \Pi_{\ell-1}.$$

Proof.

The matrix product on the right hand side is

$$\begin{aligned} \mathsf{\Pi}_j \cdots \mathsf{\Pi}_{\ell-1} &= \mathsf{A}_j^{-1}\mathsf{R}_j\mathsf{A}_{j+1}\mathsf{A}_{j+1}^{-1}\mathsf{R}_{j+1}\mathsf{A}_{j+2}\cdots\mathsf{A}_{\ell-1}^{-1}\mathsf{R}_{\ell-1}\mathsf{A}_\ell \\ &= \mathsf{A}_j^{-1}\mathsf{R}_j\mathsf{R}_{j+1}\cdots\mathsf{R}_{\ell-1}\mathsf{A}_\ell \\ &= \mathsf{\Pi}_{j,\ell}. \end{aligned}$$

$\square$

Definition (Multilevel Ritz Projection Matrix)

Define, for any $0 \leq j < \ell$, the **multilevel Ritz projection matrix** via

$$\tilde{\Pi}_{j,\ell} := \mathsf{P}_{j,\ell}\Pi_{j,\ell} \in \mathbb{R}^{n_\ell \times n_\ell}.$$

Observe that

$$\tilde{\Pi}_{\ell-1,\ell} = \tilde{\Pi}_\ell \in \mathbb{R}^{n_\ell \times n_\ell}.$$

Theorem

Let $\mathcal{A}(\cdot,\cdot)$ and V_ℓ be defined as usual for the conforming finite method. Let $0 \le j < \ell$ and $u_\ell \in V_\ell$ be arbitrary. Set

$$u_j' = \mathcal{R}_j u_\ell \in V_j \overset{\mathcal{B}_j}{\leftrightarrow} \boldsymbol{u}_j' \in \mathbb{R}^{n_j}.$$

Then, if $\boldsymbol{u}_\ell$ is the coordinate vector of $u_\ell \in V_\ell$ with respect to the basis $\mathcal{B}_\ell$, it follows that the unique representation of $\mathcal{R}_j u_\ell \in V_j$ in the basis $\mathcal{B}_j$ is precisely

$$\boldsymbol{u}_j' = \Pi_{j,\ell} \boldsymbol{u}_\ell \in \mathbb{R}^{n_j}.$$

Further, the unique representation of $\mathcal{R}_j u_\ell \in V_\ell$ in the basis $\mathcal{B}_\ell$ is precisely

$$\tilde{\Pi}_{j,\ell} \boldsymbol{u}_\ell \in \mathbb{R}^{n_\ell}.$$

Proof.

Let $u_\ell \in V_\ell$ be given. $\mathcal{R}_j u_\ell$ is defined as the unique solution to

$$\mathcal{A}\left(\mathcal{R}_j u_\ell, v_j\right) = \mathcal{A}\left(u_\ell, v_j\right), \quad \forall\ v_j \in V_j.$$

Then,

$$\mathcal{A}\left(\mathcal{R}_j u_\ell, v_j\right) = \left(\boldsymbol{u}_j', \boldsymbol{v}_j\right)_{\mathsf{A}_j}.$$

On the other hand

$$\mathcal{A}\left(u_\ell, v_j\right) = \left(\boldsymbol{u}_\ell, \mathsf{P}_{j,\ell}\boldsymbol{v}_j\right)_{\mathsf{A}_\ell},$$

where

$$\boldsymbol{v}_j \in \mathbb{R}^{n_j} \overset{\mathcal{B}_j}{\leftrightarrow} v_j \in V_j,$$

as usual.

Proof (Cont.)

Going further, we have

$$\begin{aligned} \mathcal{A}\left(u_\ell, v_j\right) &= \left(\mathsf{A}_\ell \boldsymbol{u}_\ell, \mathsf{P}_{j,\ell} \boldsymbol{v}_j\right)_\ell \\ &= \left(\mathsf{R}_{j,\ell} \mathsf{A}_\ell \boldsymbol{u}_\ell, \boldsymbol{v}_j\right)_j, \end{aligned}$$

and

$$\mathcal{A}\left(\mathcal{R}_j u_\ell, v_j\right) = \left(\mathsf{A}_j \boldsymbol{u}_j', \boldsymbol{v}_j\right)_j.$$

Therefore,

$$\mathsf{A}_j \boldsymbol{u}_j' = \mathsf{R}_{j,\ell} \mathsf{A}_\ell \boldsymbol{u}_\ell,$$

or

$$\boldsymbol{u}_j' = \mathsf{A}_j^{-1} \mathsf{R}_{j,\ell} \mathsf{A}_\ell \boldsymbol{u}_\ell = \Pi_{j,\ell} \boldsymbol{u}_\ell.$$

The second part follows from a previous Lemma. □

Definition (Multilevel T-matrix)

Define, for any $0 \leq j < \ell$,

$$\mathsf{T}_{j,\ell}(m) := \Pi_{j,\ell} - \mathsf{K}_j^m \Pi_{j,\ell} \in \mathbb{R}^{n_j \times n_\ell},$$

where m is a non-negative integer exponent. Define

$$\tilde{\mathsf{T}}_{j,\ell}(m) = \mathsf{P}_{j,\ell} \mathsf{T}_{j,\ell}(m) \in \mathbb{R}^{n_\ell \times n_\ell},$$

The square matrix $\tilde{\mathsf{T}}_{j,\ell}$ is called a **multilevel** T-**matrix**.

Remark

Whenever the number of smoothing steps m is understood, we write $\mathsf{T}_{j,\ell}$ *in stead of* $\mathsf{T}_{j,\ell}(m)$ *and* $\tilde{\mathsf{T}}_{j,\ell}$ *instead of* $\tilde{\mathsf{T}}_{j,\ell}(m)$*. Of course,* $\tilde{\mathsf{T}}_{j,\ell}(0) = \mathsf{O}$*.*

Properties of the Multilevel Matrices

Now, let us investigate some properties of the objects that we have just created.

Proposition

Let $0 \leq j < \ell$. *Then*

$$\Pi_{j,\ell} \mathsf{P}_{j,\ell} = \mathsf{I}_j, \tag{1}$$

and

$$\tilde{\Pi}_{j,\ell}^2 = \tilde{\Pi}_{j,\ell}.$$

Proof.

The Galerkin condition holds in the sense that

$$\mathsf{A}_j = \mathsf{R}_{j,\ell}\mathsf{A}_\ell\mathsf{P}_{j,\ell}. \tag{2}$$

By definition

$$\Pi_{j,\ell} = \mathsf{A}_j^{-1}\mathsf{R}_{j,\ell}\mathsf{A}_\ell,$$

so that

$$\begin{aligned}\Pi_{j,\ell}\mathsf{P}_{j,\ell} &= \mathsf{A}_j^{-1}\mathsf{R}_{j,\ell}\mathsf{A}_\ell\mathsf{P}_{j,\ell}\\ &= \mathsf{A}_j^{-1}\mathsf{A}_j\\ &= \mathsf{I}_j.\end{aligned}$$

Now,

$$\tilde{\Pi}_{j,\ell}^2 = \mathsf{P}_{j,\ell}\Pi_{j,\ell}\mathsf{P}_{j,\ell}\Pi_{j,\ell} = \mathsf{P}_{j,\ell}\Pi_{j,\ell} = \tilde{\Pi}_{j,\ell}.$$

□

Definition

Let $0 \leq j < \ell$. Define

$$\mathsf{T}'_{j,\ell} := \Pi_{j,\ell} - (\mathsf{K}_j^*)^m \Pi_{j,\ell}$$

and

$$\tilde{\mathsf{T}}'_{j,\ell} := \mathsf{P}_{j,\ell}\mathsf{T}'_{j,\ell},$$

where

$$\mathsf{K}_j^* = \mathsf{I}_j - \mathsf{S}_j^\top \mathsf{A}_j,$$

as usual.

Proposition

Let $0 \leq j < \ell$. *Then*

$$\tilde{\Pi}_{j,\ell}^{*} = \tilde{\Pi}_{j,\ell}, \tag{3}$$

and

$$\tilde{\mathsf{T}}_{j,\ell}^{*} = \tilde{\mathsf{T}}_{j,\ell}'.$$

Proof.

Recall

$$\left(\tilde{\Pi}_{j,\ell}\boldsymbol{u}_\ell, \boldsymbol{v}_\ell\right)_{\mathsf{A}_\ell} = \left(\boldsymbol{u}_\ell, \tilde{\Pi}^*_{j,\ell}\boldsymbol{v}_\ell\right)_{\mathsf{A}_\ell},$$

for all $\boldsymbol{u}_\ell, \boldsymbol{v}_\ell \in \mathbb{R}^{n_\ell}$. Then

$$\begin{aligned}
\left(\tilde{\Pi}_{j,\ell}\boldsymbol{u}_\ell, \boldsymbol{v}_\ell\right)_{\mathsf{A}_\ell} &= \left(\mathsf{P}_{j,\ell}\Pi_{j,\ell}\boldsymbol{u}_\ell, \mathsf{A}_\ell\boldsymbol{v}_\ell\right)_\ell \\
&= \left(\Pi_{j,\ell}\boldsymbol{u}_\ell, \mathsf{R}_{j,\ell}\mathsf{A}_\ell\boldsymbol{v}_\ell\right)_j \\
&= \left(\mathsf{A}_j^{-1}\mathsf{R}_{j,\ell}\mathsf{A}_\ell\boldsymbol{u}_\ell, \mathsf{R}_{j,\ell}\mathsf{A}_\ell\boldsymbol{v}_\ell\right)_j \\
&= \left(\mathsf{R}_{j,\ell}\mathsf{A}_\ell\boldsymbol{u}_\ell, \mathsf{A}_j^{-1}\mathsf{R}_{j,\ell}\mathsf{A}_\ell\boldsymbol{v}_\ell\right)_j \\
&= \left(\mathsf{A}_\ell\boldsymbol{u}_\ell, \tilde{\Pi}_{j,\ell}\boldsymbol{v}_\ell\right)_\ell \\
&= \left(\boldsymbol{u}_\ell, \tilde{\Pi}_{j,\ell}\boldsymbol{v}_\ell\right)_{\mathsf{A}_\ell}.
\end{aligned}$$

Thus,

$$\tilde{\Pi}^*_{j,\ell} = \tilde{\Pi}_{j,\ell}.$$

Proof (Cont.)

Now,

$$\tilde{\mathsf{T}}_{j,\ell} = \tilde{\Pi}_{j,\ell} - \mathsf{P}_{j,\ell}\mathsf{K}_j^m \Pi_{j,\ell}$$

and

$$\begin{aligned}
\left(\tilde{\mathsf{T}}_{j,\ell}\boldsymbol{u}_\ell, \boldsymbol{v}_\ell\right)_{\mathsf{A}_\ell} &= \left(\tilde{\Pi}_{j,\ell}\boldsymbol{u}_\ell, \boldsymbol{v}_\ell\right)_{\mathsf{A}_\ell} - \left(\mathsf{P}_{j,\ell}\mathsf{K}_j^m \Pi_{j,\ell}\boldsymbol{u}_\ell, \boldsymbol{v}_\ell\right)_{\mathsf{A}_\ell} \\
&= \left(\boldsymbol{u}_\ell, \tilde{\Pi}_{j,\ell}\boldsymbol{v}_\ell\right)_{\mathsf{A}_\ell} - \left(\mathsf{P}_{j,\ell}\mathsf{K}_j^m \Pi_{j,\ell}\boldsymbol{u}_\ell, \mathsf{A}_\ell\boldsymbol{v}_\ell\right)_\ell \\
&= \left(\boldsymbol{u}_\ell, \tilde{\Pi}_{j,\ell}\boldsymbol{v}_\ell\right)_{\mathsf{A}_\ell} - \left(\mathsf{K}_j^m \Pi_{j,\ell}\boldsymbol{u}_\ell, \mathsf{R}_{j,\ell}\mathsf{A}_\ell\boldsymbol{v}_\ell\right)_j \\
&= \left(\boldsymbol{u}_\ell, \tilde{\Pi}_{j,\ell}\boldsymbol{v}_\ell\right)_{\mathsf{A}_\ell} - \left(\mathsf{K}_j^m \Pi_{j,\ell}\boldsymbol{u}_\ell, \mathsf{A}_j\mathsf{A}_j^{-1}\mathsf{R}_{j,\ell}\mathsf{A}_\ell\boldsymbol{v}_\ell\right)_j \\
&= \left(\boldsymbol{u}_\ell, \tilde{\Pi}_{j,\ell}\boldsymbol{v}_\ell\right)_{\mathsf{A}_\ell} - \left(\mathsf{K}_j^m \Pi_{j,\ell}\boldsymbol{u}_\ell, \mathsf{A}_j^{-1}\mathsf{R}_{j,\ell}\mathsf{A}_\ell\boldsymbol{v}_\ell\right)_{\mathsf{A}_j} \\
&= \left(\boldsymbol{u}_\ell, \tilde{\Pi}_{j,\ell}\boldsymbol{v}_\ell\right)_{\mathsf{A}_\ell} - \left(\Pi_{j,\ell}\boldsymbol{u}_\ell, \left(\mathsf{K}_j^m\right)^* \Pi_{j,\ell}\boldsymbol{v}_\ell\right)_{\mathsf{A}_j} \\
&= \left(\boldsymbol{u}_\ell, \tilde{\Pi}_{j,\ell}\boldsymbol{v}_\ell\right)_{\mathsf{A}_\ell} - \left(\Pi_{j,\ell}\boldsymbol{u}_\ell, \left(\mathsf{K}_j^*\right)^m \Pi_{j,\ell}\boldsymbol{v}_\ell\right)_{\mathsf{A}_j}.
\end{aligned}$$

Proof (Cont.)

Continuing,

$$\begin{aligned}
\left(\tilde{\mathsf{T}}_{j,\ell}\boldsymbol{u}_\ell, \boldsymbol{v}_\ell\right)_{\mathsf{A}_\ell} &= \left(\boldsymbol{u}_\ell, \tilde{\Pi}_{j,\ell}\boldsymbol{v}_\ell\right)_{\mathsf{A}_\ell} - \left(\mathsf{A}_j^{-1}\mathsf{R}_{j,\ell}\mathsf{A}_\ell\boldsymbol{u}_\ell, \left(\mathsf{K}_j^*\right)^m \Pi_{j,\ell}\boldsymbol{v}_\ell\right)_{\mathsf{A}_j} \\
&= \left(\boldsymbol{u}_\ell, \tilde{\Pi}_{j,\ell}\boldsymbol{v}_\ell\right)_{\mathsf{A}_\ell} - \left(\mathsf{R}_{j,\ell}\mathsf{A}_\ell\boldsymbol{u}_\ell, \left(\mathsf{K}_j^*\right)^m \Pi_{j,\ell}\boldsymbol{v}_\ell\right)_j \\
&= \left(\boldsymbol{u}_\ell, \tilde{\Pi}_{j,\ell}\boldsymbol{v}_\ell\right)_{\mathsf{A}_\ell} - \left(\mathsf{A}_\ell\boldsymbol{u}_\ell, \mathsf{P}_{j,\ell}\left(\mathsf{K}_j^*\right)^m \Pi_{j,\ell}\boldsymbol{v}_\ell\right)_\ell \\
&= \left(\boldsymbol{u}_\ell, \tilde{\Pi}_{j,\ell}\boldsymbol{v}_\ell\right)_{\mathsf{A}_\ell} - \left(\boldsymbol{u}_\ell, \mathsf{P}_{j,\ell}\left(\mathsf{K}_j^*\right)^m \Pi_{j,\ell}\boldsymbol{v}_\ell\right)_{\mathsf{A}_\ell} \\
&= \left(\boldsymbol{u}_\ell, \tilde{\mathsf{T}}'_{j,\ell}\boldsymbol{v}_\ell\right)_{\mathsf{A}_\ell}.
\end{aligned}$$

Thus,

$$\tilde{\mathsf{T}}^*_{j,\ell} = \tilde{\mathsf{T}}'_{j,\ell}.$$

□

Remark

We note that, in general

$$\tilde{\mathsf{T}}_{j,\ell}^2 \neq \tilde{\mathsf{T}}_{j,\ell}.$$

In other words, the T *matrix,* $\tilde{\mathsf{T}}_{j,\ell}$*, is not a projection matrix.*

Theorem

Let $0 \le j < \ell$. *Then*

$$\left(\mathsf{I}_\ell - \tilde{\Pi}_{j,\ell}\right)\left(\mathsf{I}_\ell - \tilde{\mathsf{T}}_{j,\ell}\right) = \mathsf{I}_\ell - \tilde{\Pi}_{j,\ell}, \tag{4}$$

and

$$\left(\mathsf{I}_\ell - \tilde{\mathsf{T}}^*_{j,\ell}\right)\left(\mathsf{I}_\ell - \tilde{\Pi}_{j,\ell}\right) = \mathsf{I}_\ell - \tilde{\Pi}_{j,\ell}. \tag{5}$$

Proof.

The left hand side of (4) is

$$\mathsf{M}_\ell := \mathsf{I}_\ell - \tilde{\Pi}_{j,\ell} - \tilde{\mathsf{T}}_{j,\ell} + \tilde{\Pi}_{j,\ell}\tilde{\mathsf{T}}_{j,\ell}.$$

By definition,

$$\begin{aligned} \tilde{\Pi}_{j,\ell}\tilde{\mathsf{T}}_{j,\ell} &= \mathsf{P}_{j,\ell}\Pi_{j,\ell}\mathsf{P}_{j,\ell}\mathsf{T}_{j,\ell} \\ &\overset{(1)}{=} \mathsf{P}_{j,\ell}\mathsf{I}_j\mathsf{T}_{j,\ell} \\ &= \tilde{\mathsf{T}}_{j,\ell}. \end{aligned}$$

So,

$$\mathsf{M}_\ell := \mathsf{I}_\ell - \tilde{\Pi}_{j,\ell} - \tilde{\mathsf{T}}_{j,\ell} + \tilde{\mathsf{T}}_{j,\ell} = \mathsf{I}_\ell - \tilde{\Pi}_{j,\ell}.$$

Proof (Cont.)

The left hand side of (5) is

$$\mathsf{M}'_\ell = \mathsf{I}_\ell - \tilde{\mathsf{T}}^*_{j,\ell} - \tilde{\Pi}_{j,\ell} + \tilde{\mathsf{T}}^*_{j,\ell}\tilde{\Pi}_{j,\ell}.$$

Similarly,

$$\begin{aligned}
\tilde{\mathsf{T}}^*_{j,\ell}\tilde{\Pi}_{j,\ell} &= \mathsf{P}_{j,\ell}\mathsf{T}'_{j,\ell}\mathsf{P}_{j,\ell}\Pi_{j,\ell} \\
&= \mathsf{P}_{j,\ell}\left(\Pi_{j,\ell} - (\mathsf{K}_j^*)^m\Pi_{j,\ell}\right)\mathsf{P}_{j,\ell}\Pi_{j,\ell} \\
&\overset{(1)}{=} \mathsf{P}_{j,\ell}\left(\mathsf{I}_{j,\ell} - (\mathsf{K}_j^*)^m\right)\Pi_{j,\ell} \\
&= \tilde{\mathsf{T}}^*_{j,\ell}.
\end{aligned}$$

Thus,

$$\mathsf{M}'_\ell = \mathsf{I}_\ell - \tilde{\Pi}_{j,\ell},$$

as desired. □

Proposition

Let $0 \leq j < \ell$. *Then,*

$$\mathsf{I}_\ell - \tilde{\Pi}_{j,\ell} = \left(\mathsf{I}_\ell - \tilde{\mathsf{T}}^*_{j,\ell}\right) \left(\mathsf{I}_\ell - \tilde{\Pi}_{j,\ell}\right) \left(\mathsf{I}_\ell - \tilde{\mathsf{T}}_{j,\ell}\right). \tag{6}$$

Proof.

Since the Galerkin condition holds, $\tilde{\Pi}_{j,\ell}$ is a bona fide projection matrix:

$$\tilde{\Pi}_{j,\ell}^2 = \tilde{\Pi}_{j,\ell},$$

and

$$\left(\mathsf{I}_\ell - \tilde{\Pi}_{j,\ell}\right)^2 = \mathsf{I}_\ell - \tilde{\Pi}_{j,\ell}$$

is a direct consequence. By the last result

$$\begin{aligned}
\mathsf{I}_\ell - \tilde{\Pi}_{j,\ell} &= \left(\mathsf{I}_\ell - \tilde{\Pi}_{j,\ell}\right)\left(\mathsf{I}_\ell - \tilde{\Pi}_{j,\ell}\right) \\
&\overset{(4)}{\underset{(5)}{=}} \left(\mathsf{I}_\ell - \tilde{\mathsf{T}}_{j,\ell}^*\right)\left(\mathsf{I}_\ell - \tilde{\Pi}_{j,\ell}\right)\left(\mathsf{I}_\ell - \tilde{\Pi}_{j,\ell}\right)\left(\mathsf{I}_\ell - \tilde{\mathsf{T}}_{j,\ell}\right) \\
&= \left(\mathsf{I}_\ell - \tilde{\mathsf{T}}_{j,\ell}^*\right)\left(\mathsf{I}_\ell - \tilde{\Pi}_{j,\ell}\right)\left(\mathsf{I}_\ell - \tilde{\mathsf{T}}_{j,\ell}\right).
\end{aligned}$$

□

Proposition

Let $0 \leq i < j < \ell$. *Then*

$$\mathsf{P}_{j,\ell}\left(\mathsf{I}_j - \tilde{\mathsf{T}}_{i,j}\right) = \left(\mathsf{I}_\ell - \tilde{\mathsf{T}}_{i,\ell}\right)\mathsf{P}_{j,\ell}. \tag{7}$$

Proof.

$$
\begin{aligned}
\mathsf{P}_{j,\ell}\left(\mathsf{I}_j - \tilde{\mathsf{T}}_{i,j}\right) &\overset{(1)}{=} \mathsf{P}_{j,\ell}\left(\mathsf{I}_j - \tilde{\mathsf{T}}_{i,j}\right)\Pi_{j,\ell}\mathsf{P}_{j,\ell} \\
&= \{\mathsf{P}_{j,\ell}\Pi_{j,\ell} - \mathsf{P}_{j,\ell}\mathsf{P}_{i,j}\mathsf{T}_{i,j}\Pi_{j,\ell}\}\,\mathsf{P}_{j,\ell} \\
&= \left\{\tilde{\Pi}_{j,\ell} - \mathsf{P}_{i,\ell}\left(\Pi_{i,j} - \mathsf{K}_i^m\Pi_{i,j}\right)\Pi_{j,\ell}\right\}\mathsf{P}_{j,\ell} \\
&= \left\{\tilde{\Pi}_{j,\ell} - \mathsf{P}_{i,\ell}\Pi_{i,\ell} + \mathsf{P}_{i,\ell}\mathsf{K}_i^m\Pi_{i,\ell}\right\}\mathsf{P}_{j,\ell} \\
&= \left\{\tilde{\Pi}_{j,\ell} - \tilde{\mathsf{T}}_{i,\ell}\right\}\mathsf{P}_{j,\ell} \\
&= \mathsf{P}_{j,\ell}\Pi_{j,\ell}\mathsf{P}_{j,\ell} - \tilde{\mathsf{T}}_{i,\ell}\mathsf{P}_{j,\ell} \\
&\overset{(1)}{=} \left(\mathsf{I}_\ell - \tilde{\mathsf{T}}_{i,\ell}\right)\mathsf{P}_{j,\ell}.
\end{aligned}
$$

□

Corollary

Let $0 \leq i < j < \ell$. *Then*

$$\mathsf{P}_{j,\ell}\left(\mathsf{I}_j - \tilde{\Pi}_{i,j}\right) = \left(\mathsf{I}_\ell - \tilde{\Pi}_{i,\ell}\right)\mathsf{P}_{j,\ell}. \tag{8}$$

Multigrid Error Transfer Matrices in Multiplicative Forms

Now, using the definitions and properties of the multilevel matrices, we can rewrite the error transfer matrices of some of the common multigrid algorithms.

Theorem

Let V_ℓ, $\mathcal{T}_\ell$, and $\mathcal{A}(\cdot,\cdot)$ be defined as usual. Consider the symmetric V-cycle algorithm: $m = m_1 = m_2$ and $p = 1$. The error transfer matrix can be expressed as

$$\begin{aligned} \mathsf{E}_\ell \quad = \quad & (\mathsf{K}_\ell^*)^m \left(\mathsf{I}_\ell - \tilde{\mathsf{T}}^*_{\ell-1,\ell}\right) \times \cdots \times \left(\mathsf{I}_\ell - \tilde{\mathsf{T}}^*_{1,\ell}\right) \left(\mathsf{I}_\ell - \tilde{\Pi}_{0,\ell}\right) \\ & \times \left(\mathsf{I}_\ell - \tilde{\mathsf{T}}_{1,\ell}\right) \times \cdots \times \left(\mathsf{I}_\ell - \tilde{\mathsf{T}}_{\ell-1,\ell}\right) (\mathsf{K}_\ell)^m, \end{aligned} \tag{9}$$

for all $\ell \geq 1$.

Proof.

Define the quantity

$$\mathsf{M}_{j,\ell} := \mathsf{I}_\ell - \tilde{\Pi}_{j,\ell} + \mathsf{P}_{j,\ell}\mathsf{E}_j\Pi_{j,\ell},$$

for any $0 \leq j < \ell$. Observe that, when $j = 0$,

$$\mathsf{M}_{0,\ell} = \mathsf{I}_\ell - \tilde{\Pi}_{0,\ell},$$

since $\mathsf{E}_0 = 0$. Then,

$$\mathsf{M}_{j,\ell} = \mathsf{I}_\ell - \tilde{\Pi}_{j,\ell} + \mathsf{P}_{j,\ell}\left(\mathsf{K}_j^*\right)^m \left(\mathsf{I}_j - \tilde{\Pi}_{j-1,j} + \mathsf{P}_{j-1,j}\mathsf{E}_{j-1}\Pi_{j-1,j}\right)\mathsf{K}_j^m\Pi_{j,\ell}. \tag{10}$$

In other words,

$$\mathsf{M}_{j,\ell} = \mathsf{I}_\ell - \tilde{\Pi}_{j,\ell} + \mathsf{P}_{j,\ell}\left(\mathsf{K}_j^*\right)^m \mathsf{M}_{j-1,j}\mathsf{K}_j^m\Pi_{j,\ell}.$$

Proof (Cont.)

Now, observe that

$$
\begin{aligned}
\mathsf{P}_{j,\ell}\left(\mathsf{K}_j^*\right)^m &\overset{(1)}{=} \mathsf{P}_{j,\ell}\left(\mathsf{K}_j^*\right)^m \Pi_{j,\ell}\mathsf{P}_{j,\ell} \\
&= \left(\mathsf{P}_{j,\ell}\Pi_{j,\ell} - \mathsf{P}_{j,\ell}\Pi_{j,\ell} + \mathsf{P}_{j,\ell}\left(\mathsf{K}_j^*\right)^m \Pi_{j,\ell}\right)\mathsf{P}_{j,\ell} \\
&= \left(\mathsf{P}_{j,\ell}\Pi_{j,\ell} - \tilde{\mathsf{T}}_{j,\ell}^*\right)\mathsf{P}_{j,\ell} \\
&= \mathsf{P}_{j,\ell}\Pi_{j,\ell}\mathsf{P}_{j,\ell} - \tilde{\mathsf{T}}_{j,\ell}^*\mathsf{P}_{j,\ell} \\
&\overset{(1)}{=} \left(\mathsf{I}_\ell - \tilde{\mathsf{T}}_{j,\ell}^*\right)\mathsf{P}_{j,\ell}.
\end{aligned} \tag{11}
$$

Proof (Cont.)

Similarly,

$$\begin{aligned} \mathsf{K}_j^m \Pi_{j,\ell} &= \Pi_{j,\ell} - \Pi_{j,\ell} + \mathsf{K}_j^m \Pi_{j,\ell} \\ &= \Pi_{j,\ell} - \mathsf{T}_{j,\ell} \\ &\overset{(1)}{=} \Pi_{j,\ell} \mathsf{P}_{j,\ell} \left(\Pi_{j,\ell} - \mathsf{T}_{j,\ell} \right) \\ &= \Pi_{j,\ell} \left(\mathsf{P}_{j,\ell} \Pi_{j,\ell} - \tilde{\mathsf{T}}_{j,\ell} \right) \\ &= \Pi_{j,\ell} \mathsf{P}_{j,\ell} \Pi_{j,\ell} - \Pi_{j,\ell} \tilde{\mathsf{T}}_{j,\ell} \\ &\overset{(1)}{=} \Pi_{j,\ell} \left(\mathsf{I}_\ell - \tilde{\mathsf{T}}_{j,\ell} \right). \end{aligned} \tag{12}$$

Proof (Cont.)

Putting (10) – (12) together, we have

$$
\begin{aligned}
\mathsf{M}_{j,\ell} &= \mathsf{I}_\ell - \tilde{\Pi}_{j,\ell} + \left(\mathsf{I}_\ell - \tilde{\mathsf{T}}^*_{j,\ell}\right)\mathsf{P}_{j,\ell}\left\{\mathsf{I}_j - \tilde{\Pi}_{j-1,j} + \mathsf{P}_{j-1,j}\mathsf{E}_{j-1}\Pi_{j-1,j}\right\} \\
&\quad \times \Pi_{j,\ell}\left(\mathsf{I}_\ell - \tilde{\mathsf{T}}_{j,\ell}\right) \\
&\overset{(6)}{=} \left(\mathsf{I}_\ell - \tilde{\mathsf{T}}^*_{j,\ell}\right)\left\{\mathsf{I}_\ell - \tilde{\Pi}_{j,\ell} + \mathsf{P}_{j,\ell}\left(\mathsf{I}_j - \tilde{\Pi}_{j-1,j} + \mathsf{P}_{j-1,j}\mathsf{E}_{j-1}\Pi_{j-1,j}\right)\Pi_{j,\ell}\right\} \\
&\quad \times \left(\mathsf{I}_\ell - \tilde{\mathsf{T}}_{j,\ell}\right) \\
&= \left(\mathsf{I}_\ell - \tilde{\mathsf{T}}^*_{j,\ell}\right)\left\{\mathsf{I}_\ell - \tilde{\Pi}_{j,\ell} + \tilde{\Pi}_{j,\ell} - \tilde{\Pi}_{j-1,\ell} + \mathsf{P}_{j-1,\ell}\mathsf{E}_{j-1}\Pi_{j-1,\ell}\right\} \\
&\quad \times \left(\mathsf{I}_\ell - \tilde{\mathsf{T}}_{j,\ell}\right).
\end{aligned}
$$

Proof (Cont.)

Or, equivalently,

$$\mathsf{M}_{j,\ell} = \left(\mathsf{I}_\ell - \tilde{\mathsf{T}}^*_{j,\ell}\right) \mathsf{M}_{j-1,\ell} \left(\mathsf{I}_\ell - \tilde{\mathsf{T}}_{j,\ell}\right).$$

Therefore

$$\begin{aligned}
\mathsf{M}_{\ell-1,\ell} &= \left(\mathsf{I}_\ell - \tilde{\mathsf{T}}^*_{\ell-1,\ell}\right) \mathsf{M}_{\ell-2,\ell} \left(\mathsf{I}_\ell - \tilde{\mathsf{T}}_{\ell-1,\ell}\right) \\
&= \left(\mathsf{I}_\ell - \tilde{\mathsf{T}}^*_{\ell-1,\ell}\right) \left(\mathsf{I}_\ell - \tilde{\mathsf{T}}^*_{\ell-2,\ell}\right) \mathsf{M}_{\ell-3,\ell} \left(\mathsf{I}_\ell - \tilde{\mathsf{T}}_{\ell-3,\ell}\right) \left(\mathsf{I}_\ell - \tilde{\mathsf{T}}_{\ell-1,\ell}\right) \\
&\vdots \\
&= \left(\mathsf{I}_\ell - \tilde{\mathsf{T}}^*_{\ell-1,\ell}\right) \times \cdots \times \left(\mathsf{I}_\ell - \tilde{\mathsf{T}}^*_{1,\ell}\right) \left(\mathsf{I}_\ell - \tilde{\Pi}_{0,\ell}\right) \\
&\quad \times \left(\mathsf{I}_\ell - \tilde{\mathsf{T}}_{1,\ell}\right) \left(\mathsf{I}_\ell - \tilde{\mathsf{T}}_{2,\ell}\right) \times \cdots \times \left(\mathsf{I}_\ell - \tilde{\mathsf{T}}_{\ell-1,\ell}\right)
\end{aligned}$$

But recall that

$$\mathsf{E}_\ell = \left(\mathsf{K}^*_\ell\right)^m \mathsf{M}_{\ell-1,\ell} \mathsf{K}^m_\ell.$$

The result is proven. □

Remark

This theorem gives another proof of the fact that the V-Cycle multigrid method is a multiplicative GLIS, as we first defined in Chapter 01, since the error transfer matrix can be written as a product of matrices of the form

$$\mathsf{E}_\ell = \prod_k (\mathsf{I}_\ell - \mathsf{B}_\ell^{(k)} \mathsf{A}_\ell),$$

where $\left\{ \mathsf{B}_\ell^{(k)} \right\}_k$ *is a family of iterator matrices.*

Corollary

For the one-sided V-cycle with only pre-smoothing ($p = 1, m := m_1 > 0$ and $m_2 = 0$), we have

$$\mathsf{E}_\ell^{\mathrm{pre}} = \left(\mathsf{I}_\ell - \tilde{\Pi}_{0,\ell}\right)\left(\mathsf{I}_\ell - \tilde{\mathsf{T}}_{1,\ell}\right)\left(\mathsf{I}_\ell - \tilde{\mathsf{T}}_{2,\ell}\right) \times \cdots \times \left(\mathsf{I}_\ell - \tilde{\mathsf{T}}_{\ell-1,\ell}\right)\mathsf{K}_\ell^m.$$

For the algorithm with only post-smoothing ($p = 1, m := m_2 > 0$ and $m_1 = 0$), we have

$$\mathsf{E}_\ell^{\mathrm{post}} = (\mathsf{K}_\ell^*)^m \left(\mathsf{I}_\ell - \tilde{\mathsf{T}}_{\ell-1,\ell}^*\right) \times \cdots \times \left(\mathsf{I}_\ell - \tilde{\mathsf{T}}_{1,\ell}^*\right)\left(\mathsf{I}_\ell - \tilde{\Pi}_{0,\ell}\right).$$

Therefore, for the symmetric V-cycle,

$$\mathsf{E}_\ell = \mathsf{E}_\ell^{\mathrm{post}} \times \mathsf{E}_\ell^{\mathrm{pre}}.$$

Furthermore,

$$\left(\mathsf{E}_\ell^{\mathrm{post}}\right)^* = \mathsf{E}_\ell^{\mathrm{pre}}.$$

Clearly,

$$\mathsf{E}_\ell^* = \mathsf{E}_\ell = \left(\mathsf{E}_\ell^{\mathrm{pre}}\right)^* \mathsf{E}_\ell^{\mathrm{pre}}$$

is SPSD.

Theorem

Both of the one-sided V-cycle methods converge, for any $m > 0$, provided Richardson's method is used for smoothing.

Proof.

We have shown previously that there is some $C_0 > 0$ such that

$$\left\| \mathsf{E}_\ell \boldsymbol{u}_\ell \right\|_{\mathsf{A}_\ell} \leq \frac{C_0}{m + C_0} \left\| \boldsymbol{u}_\ell \right\|_{\mathsf{A}_\ell},$$

for all $\boldsymbol{u}_\ell \in \mathbb{R}^{n_\ell}$. We wish to prove that

$$\left\| \mathsf{E}_\ell^{\mathrm{pre}} \boldsymbol{u}_\ell \right\|_{\mathsf{A}_\ell} \leq \gamma \left\| \boldsymbol{u}_\ell \right\|_{\mathsf{A}_\ell},$$

for some $0 \leq \gamma < 1$.

Proof (Cont.)

Observe that

$$\begin{aligned}
\left\| \mathsf{E}_\ell^{\mathrm{pre}} \boldsymbol{u}_\ell \right\|_{\mathsf{A}_\ell}^2 &= \left(\mathsf{E}_\ell^{\mathrm{pre}} \boldsymbol{u}_\ell, \mathsf{E}_\ell^{\mathrm{pre}} \boldsymbol{u}_\ell \right)_{\mathsf{A}_\ell} \\
&= \left(\boldsymbol{u}_\ell, \left(\mathsf{E}_\ell^{\mathrm{pre}}\right)^* \mathsf{E}_\ell^{\mathrm{pre}} \boldsymbol{u}_\ell \right)_{\mathsf{A}_\ell} \\
&= \left(\boldsymbol{u}_\ell, \mathsf{E}_\ell \boldsymbol{u}_\ell \right)_{\mathsf{A}_\ell} \\
&\overset{\text{C.S.}}{\leq} \left\| \boldsymbol{u}_\ell \right\|_{\mathsf{A}_\ell} \left\| \mathsf{E}_\ell \boldsymbol{u}_\ell \right\|_{\mathsf{A}_\ell} \\
&\leq \left\| \boldsymbol{u}_\ell \right\|_{\mathsf{A}_\ell} \frac{C_0}{m + C_0} \left\| \boldsymbol{u}_\ell \right\|_{\mathsf{A}_\ell} \\
&\leq \frac{C_0}{m + C_0} \left\| \boldsymbol{u}_\ell \right\|_{\mathsf{A}_\ell}^2 .
\end{aligned}$$

Thus, taking square roots,

$$\left\| \mathsf{E}_\ell^{\mathrm{pre}} \boldsymbol{u}_\ell \right\|_{\mathsf{A}_\ell} \leq \sqrt{\frac{C_0}{m + C_0}} \left\| \boldsymbol{u}_\ell \right\|_{\mathsf{A}_\ell} .$$

$\mathsf{E}_\ell^{\mathrm{post}}$ left for an exercise. $\square$

Theorem

For the W-cycle algorithm with only pre-smoothing ($m := m_1 > 0, m_2 = 0$, $p = 2$), the error transfer matrix may be expressed as

$$\mathsf{E}_\ell^{W,\mathrm{pre}} = \mathsf{F}_\ell \mathsf{E}_\ell^{\mathrm{pre}},$$

where $\mathsf{E}_\ell^{\mathrm{pre}}$ is defined above, and $\mathsf{F}_\ell \in \mathbb{R}^{n_\ell \times n_\ell}$ is a matrix with

$$\|\mathsf{F}_\ell\|_{\mathsf{A}_\ell} \leq 1.$$

Consequently the one-sided W-cycle method with pre-smoothing converges for any $m > 0$.

Proof.

Exercise. □

Corollary

For the symmetric W-cycle algorithm ($p = 2$ and $m := m_1 = m_2$) the error transfer matrix is

$$\mathsf{E}_\ell^{W} = \left(\mathsf{E}_\ell^{\mathrm{pre}}\right)^* \mathsf{D}_\ell \mathsf{E}_\ell^{\mathrm{pre}},$$

where

$$\mathsf{E}_\ell^{\mathrm{pre}} = \left(\mathsf{I}_\ell - \tilde{\Pi}_{0,\ell}\right)\left(\mathsf{I}_\ell - \tilde{\mathsf{T}}_{1,\ell}\right)\left(\mathsf{I}_\ell - \tilde{\mathsf{T}}_{2,\ell}\right) \times \cdots \times \left(\mathsf{I}_\ell - \tilde{\mathsf{T}}_{\ell-1,\ell}\right)\mathsf{K}_\ell^{m},$$

and

$$\|\mathsf{D}_\ell\|_{\mathsf{A}_\ell} \le 1, \quad \forall\, \ell \ge 1.$$

The algorithm converges if the symmetric V-cycle algorithm converges with the uniform contraction $0 < \gamma < 1$, that is,

$$\|\mathsf{E}_\ell \boldsymbol{u}_\ell\|_{\mathsf{A}_\ell} \le \gamma \|\boldsymbol{u}_\ell\|_{\mathsf{A}_\ell},$$

for all $\boldsymbol{u}_\ell \in \mathbb{R}^{n_\ell}$, with $\mathsf{E}_\ell = \left(\mathsf{E}_\ell^{\mathrm{pre}}\right)^* \mathsf{E}_\ell^{\mathrm{pre}}$. Here γ may (and usually does) depend upon m.

Proof.

Exercise. □
